	<b>Index</b>	<b>13</b>

`pyriodic` is an in-development library to handle a database of three-dimensional structures. It also supports several simple manipulations of structures.

# CHAPTER 1

---

## Installation

---

Install *pyriodic* from source on github:

```
pip install git+https://github.com/klarh/pyriodic.git#egg=pyriodic-structures
```

By default, *pyriodic* only ships with a few very simple structures; other libraries can be added by installing other packages, such as *pyriodic-afLOW*, which contains structures from the *AFLOW* project.

#### **class** `pyrperiodic.Database`

Manage an in-memory database of structures

*Database* objects wrap a sqlite database containing structure information. Structures can be added to and read from the database.

Databases should only be written to by a single thread at once.

Currently the only table populated in the database is *unit\_cells*, with the fields:

- `name` (str): Short name of the structure type
- `space_group` (int): Integer representation of the space group of the structure
- `size` (int): Number of particles in the unit cell
- `structure` (*Structure*): Structure object

**insert\_unit\_cell** (*name*, *space\_group*, *structure*, *cursor=None*)

Insert a unit cell into this database object

#### **Parameters**

- **name** – Short name of the structure
- **space\_group** – Integer representation of the space group for the structure
- **structure** – *Structure* object to store
- **cursor** – Database connection cursor (optional)

**classmethod** `make_standard()`

Generate the standard database from all installed packages

**query** (*query*, *\*args*)

Execute a (sqlite) query on the database

Parameters are the same as for an *sqlite3* database.

**class** `pyperiodic.Structure` (*positions, types, box*)

Container for a single set of coordinates

Structure objects hold all of the important quantities for a structural example, like coordinates and the system box.

**add\_gaussian\_noise** (*magnitude*)

Add gaussian noise to each particle

**Parameters** **magnitude** – Scale of the zero-mean gaussian noise

**Returns** A new *Structure* with the gaussian noise applied.

**replicate** (*nx=1, ny=1, nz=1*)

Replicate the system a given number of times in each dimension

**Parameters**

- **nx** – Number of times to replicate in the x direction
- **ny** – Number of times to replicate in the y direction
- **nz** – Number of times to replicate in the z direction

**Returns** A new *Structure* that has been replicated appropriately

**replicate\_upto** (*N\_target*)

Replicate the system to have at least a given number of particles

Replicas are iteratively added in the shortest dimension of the box until at least *N\_target* particles are present.

**Parameters** **N\_target** – Minimum number of particles to have in the resulting structure

**Returns** A new *Structure* that has been replicated appropriately

**rescale\_linear** (*factor*)

Rescale all distances in the system by the given factor

The coordinates and box are scaled by the given factor.

**Parameters** **factor** – Number to scale all lengths in the system by

**Returns** a new *Structure* that has been scaled accordingly

**rescale\_number\_density** (*phi*)

Rescale the system to the given number density

The box and all coordinates are scaled by an appropriate factor to produce a box with the given number density (number of particles/volume).

**Parameters** **phi** – Number density of the resulting system

**Returns** a new *Structure* with the given density

**rescale\_shortest\_distance** (*l*)

Rescale the system to have the given shortest distance between points

The box and all coordinates are scaled by an appropriate factor to produce a system with the given shortest distance between any two points. This method is currently  $N^2$  in the number of points, but may be improved in the future.

**Parameters** **l** – Shortest distance of the resulting system

**Returns** a new *Structure* with the given shortest distance

**rescale\_volume** (*V*)

Rescale the system to the given volume

The box and all coordinates are scaled by an appropriate factor to produce a box with the given volume.

**Parameters** **V** – Volume of the resulting system

**Returns** a new *Structure* with the given volume

## CHAPTER 3

---

### Indices and tables

---

- `genindex`
- `modindex`
- `search`

**p**

`pyperiodic`, 5

## A

`add_gaussian_noise()` (*pyriodic.Structure method*), 6

## D

`Database` (*class in pyriodic*), 5

## I

`insert_unit_cell()` (*pyriodic.Database method*), 5

## M

`make_standard()` (*pyriodic.Database class method*), 5

## P

`pyriodic` (*module*), 5

## Q

`query()` (*pyriodic.Database method*), 5

## R

`replicate()` (*pyriodic.Structure method*), 6

`replicate_upto()` (*pyriodic.Structure method*), 6

`rescale_linear()` (*pyriodic.Structure method*), 6

`rescale_number_density()` (*pyriodic.Structure method*), 6

`rescale_shortest_distance()` (*pyriodic.Structure method*), 6

`rescale_volume()` (*pyriodic.Structure method*), 6

## S

`Structure` (*class in pyriodic*), 5
